Mobile Number	
Email	irfan@ecsbss.com

TUHUND® is developed and fully owned by ECS Business Software Solutions, a division of e-Centric Consultancy Services Pvt. Ltd.

TUHUND is one of the most comprehensive ERP systems and yet one of the simplest to use and manage. The system comes as a core backend with security, user management, CRM, employee management, payroll, accounting and task management modules inbuilt. Numerous other modules are deployed on top of the core backend exactly matching the unique business requirements of the customers. Thus TUHUND combines the advantages of traditional ERP system and the specially tailored systems which cannot be met with other ERP systems even after customization.

The system can be deployed on Internet or on Intranet with access on internal network or through VPN. The system can also be deployed in mixed mode where access over Internet can be controlled and given to pre-specified IP addresses. The IP addresses can be added or removed any time by administrator.

TUHUND is truly an Enterprise solution where Groups of Companies with their branches and departments is served by a single system. Normally, ERP systems are built to support a business entity and its branches. Therefore, with other ERP systems, at least one deployment of the ERP is required for each business entity or company.

TUHUND is probably the only ERP System that allows you to delegate the administrative tasks too. A super admin can add, remove or manage administrators any time. Any administrator can be given access rights to administer any functions or groups of functions. These access rights can also be managed across business entities and branches.

Some ERP Systems allow access to outside persons for a limited functionality. The typical examples would be suppliers to a mall being able to check the inventory position online and being able to supply just in time without the mall having to place a purchase order every time. TUHUND goes much beyond this and the access can be given to any stakeholder with foolproof user access control. The board of directors can have

their high level reports as charts and presentations available online or delivered to their through email. Vendors check new requirements, submit quotations, raise invoices, update their account details, check their statements and request payments.
