Our blog [www.softcarecs.com](http://www.softcarecs.com) has hundreds of WordPress posts and we have been experiencing website slowness reports from visitors; no matter how much we have tried enable caching, reducing wordpress plugins. We have changed our website to couple of hosting providers. As you know, Shared Hosting can be a headache for customers since thousands of customer websites share single server. We planned to move our website to VPS server & started research to find a best a vps hosting. However, including cPanel with 40GB with best bandwidth, it became expensive for a blog like ours.

As we continued research, we heard about Cloud Shared Hosting by Sam Networks, a small but powerful hosting company. We contacted their live chat & asked for offers. We could not get a offer price but they have promised us to get our website files / emails, domain settings migrated to their server for free as well as they have helped us on many web hosting aspects, where we have never received from any other hosting providers before.

Let us list how they helped us on website (Cloud cPanel Enterprise R11; plan we selected):

**Plan features:**

- 6,000 per year
- Nginx / Apache Server
- Solid State Disk [SSD]
- Latest PHP / MySQL
- Disk Quota – 5000MB

---

cPanel Control Panel  
Quick Upgradeable

Customer support ticket help provided by Sam Networks!:

1. File / database & email migration to their Cloud Shared server.
2. zlib comprssion, mod\_deflate & other caching htaccess tweaks.
3. Help on minifying css js contents [as they said].
4. Image optimiation.

Our blog was taking around 12-16 seconds on pingdom. But now our website loads within 4 seconds; even with 25+ wordpress plugins & content.

Don't believe us? Test yourself at: <https://tools.pingdom.com/#!/czB2YD/http://www.softcarecs.com/> . Also, our post pages from Google loads within 2-3 seconds. For a Shared Cloud Hosting with CMS like WordPress, this is fantastic!

They have been very transparent to us about technology. You can check out their company page for more details. Also, they have data centers available in 15 locations worldwide including North America, Europe, Asia and Australia.
