

# Strut Manufacturers in the USA

<b>Address</b>	17090 Brokern Bow Court
<b>Contact Person</b>	Mini Fabrication
<b>Mobile Number</b>	
<b>Email</b>	minifastindia.us@gmail.com

The strut is an important component of an automotive suspension system. This is the steel channel that supports the strut and is usually made of steel or aluminum. A typical stud is one five-eighth inch by one-half inch and is 41 mm wide. Many speculators will choose this strut for their vehicle suspension systems, since they are often the best option for low-stress applications. Strut Channel Manufacturer USA

Strut is a standardized structural system, which is commonly used for light structural support. It is typically made of metal sheet that is folded into an open channel shape. The strut has inward-curving lips, which provide additional stiffness and a place to mount connecting components. Increasingly, struts are made of fiberglass. While they are generally made from steel, they can also be made from fiberglass. They are lightweight and strong, and they are commonly fabricated with a variety of accessories.
